

Weekly Safety Meeting Signaling Techniques

Date:	Jobsite:

Discussion Leader:	Summary
Discussion Leader.	Proper signaling can greatly increase the efficiency and productivity of a construction project whether it is guiding a delivery vehicle, a
	forklift or a crane. Improper signaling can kill or injure workers as well as cause severe property damage on a project. The following
Attendance Sign- In:	points are recommended discussion points when discussing signaling.
	Guide for Discussion
	Know the signals. If you have to, get with the operator and coordinate what signals mean.
	Allow only one person to give signals.
	Be sure the operator knows who the signal person is.
	The signal person must:
	Always be in a position to see both the operator and the work area.
	Always watch the load; the operator must watch the signal person.
	Not move a suspended load over workers.
	Always warn workers when loads are being moved in their area.
	 Watch for overhead power lines and any other obstructions.
	Remember the proper type of signaling operation – for a truck, forklift or crane.
	Additional Discussion Notes:
	
	Remember
	It only takes one small mistake on the part of the signal person to cause a severe injury or major property damage. Make sure you and
	the operator understand each other and the signals to be used.
